SCIENCE AND COMMUNITY ENVIRONMENTAL KNOWLEDGE FUND BOREAL CARIBOU TELEMETRY PROGRAM

FIXED-WING TELEMETRY MONITORING FLIGHT – July 14-15, 2014

Date: July 18, 2014

Attention: Brian Thomson
Science and Community Environmental Knowledge Fund
Victoria, BC

Executive Summary

One hundred fifty-four boreal caribou collar frequencies and 22 wolf collar frequencies were scanned during a monthly fixed-wing telemetry monitoring flight conducted on July 14-15, 2014. One hundred fifty caribou collars were transmitting normal VHF signals, 2 were transmitting mortality signals (SCEK006, SCEK141), and 2 were not detected. Two wolf collar mortality signals were also detected (BW022, BW029).

Background

During the winters of 2012-13 and 2013-14, 204 adult boreal caribou were radio-collared in British Columbia's boreal caribou ranges as part of the *British Columbia Boreal Caribou Implementation Plan* (BCIP). On July 14-15, 2014, Diversified Environmental Services (DES) conducted a fixed-wing monitoring flight under contract to the Science and Community Environmental Knowledge Fund (SCEK), on behalf of the Research and Effectiveness Monitoring Board (REMB). Fixed-wing monitoring flights are conducted at monthly intervals throughout the year in order to identify mortality events to be followed up by ground-based mortality investigations and collar recoveries and to track potential long distance seasonal movements of VHF-collared caribou.

Objectives

The objective of the July 2014 monitoring flight was to determine the approximate location and VHF beacon status of all boreal caribou and wolf collars believed to be active in the survey area. These included caribou collars deployed on behalf of SCEK, caribou and wolf collars deployed on behalf of the Ministry of Forests, Lands, and Natural Resource Operations (MFLNRO), and pre-existing collars known to have entered BC's boreal caribou ranges from adjacent jurisdictions.

Methods

The monitoring flight was conducted using a Cessna 180 fixed-wing aircraft equipped with 1 outward-facing directional antenna affixed to each wing strut. Collar frequencies were scanned using Lotek™ STR 1000 and Lotek BioTracker telemetry receivers. The flight was conducted at 700-1,000 m above ground level at an average speed of 160 km/hr. The VHF beacon status of all detected collars was recorded on hard copy forms. In the case of VHF collars (Lotek LMRT4), status was recorded as either normal (60 pulses per minute (ppm)) or mortality mode (120 ppm) and a location (+/- 1 km) was recorded using a hand-held GPS unit. In the case of GPS/satellite collars (ATS Iridium, Vectronic Vertex, and Lotek LifeCycle), additional diagnostic VHF beacon patterns were recorded where applicable. As GPS/satellite collars are programmed to log multiple daily locations with high precision, additional effort to obtain collar locations after VHF signal detection is not necessary. Therefore, waypoints for GPS/satellite collars were typically recorded at the location from which the collar was heard, with

corrections for estimated bearing and distance, unless the VHF beacon status indicated a collar malfunction or mortality, in which case, more precise locations were obtained.

Results

One hundred fifty-four caribou collar frequencies were scanned during the July 14-15, 2014 monitoring flight, including 148 SCEK collars (27 ATS Iridium, 31 Vectronic Vertex, 11 Lotek LifeCycle, and 79 Lotek VHF), 2 Alberta VHF collars, and 4 previously-deployed MFLNRO VHF collars. In addition, 22 wolf collar frequencies were scanned during the July 2014 flight (15 Lotek Iridium, 1 Vectronic Vertex, and 6 Lotek VHF).

Results of the July 14-15, 2014 monitoring flight are presented in Table 1. Flight paths searched within and adjacent to each core habitat area are shown in Figure 1. Total flight line distance was 2,955 km. Of 154 caribou collar frequencies scanned, 150 normal VHF signals and 2 mortality signals were detected.

July 2014 caribou mortality indications included SCEK006 (Kiwigana, Lotek VHF) and SCEK141 (Chinchaga RRA, Lotek VHF). SCEK029 (Milligan, VHF) is presumed active, but was not detected during the July 2014 flight. The remaining caribou collar (SCEK042, Milligan, Iridium) was not detected and is believed to have experienced a failure of both Iridium and VHF functions in May 2013, shortly after deployment.

At the time of the July 2014 monitoring flight, 4 Calendar caribou were located up to 40 km north of the BC/NT border (SCEK122, SCEK125, SCEK126, and SCEK180).

Twenty-two wolf collar frequencies were scanned during the July 14-15, 2014 monitoring flight, including 15 Lotek Iridium, 1 Vectronic Vertex, and 6 Lotek VHF. One GPS wolf collar (BW018, Elleh Pack) was heard in low battery mode during the June 2014 flight but was shot by a hunter prior to the July 2014 flight; the collar was turned in to the Fort Nelson Conservation Officer Service. One additional GPS collar (BW003, West Clarke Pack), which failed 15 days after deployment in April 2013 and was not being scanned, was also killed by a hunter in June 2014. This collar was also turned in to the Conservation Officer Service.

Of the 16 GPS/satellite wolf collars scanned, 8 had normal VHF beacon function and an additional 2 had current Iridium data function but had moved north into the Northwest Territories, beyond VHF reception range (BW010 and BW028; Snake Pack). Of the 6 remaining GPS/satellite wolf collars, 1 is suspected to have failed in 2013 (BW012; Big Arrow Pack), 4 were not detected and ceased Iridium data transmission prior to the July flight, and one was located in VHF mortality mode (BW029; Clarke Pack).

Of the 6 VHF wolf collars scanned, 3 had normal VHF signals, 1 was transmitting in mortality mode (BW022; Clarke Pack), 1 presumably active collar was not detected, and 1 collar assumed to have failed or dispersed soon after deployment in 2013 was not detected (BW007; Snake Pack).

At the time of the July 2014 flight, 2 GPS-collared wolves from the Snake Pack had separately dispersed well into the Northwest Territories (BW010, BW02). A third Snake Pack wolf (BW027), which also made a long distance movement well into the Northwest Territories in spring 2014 and then moved back into BC, more recently made a second movement 95 km into the NT before suddenly returning to its original pack territory near Fort Nelson in 4 days, a distance of 220 km.

There were no opportunities for First Nations field assistance on this monitoring flight.

Cordially,

Brad Culling, R.P.Bio
Diversified Environmental Services
Fort St. John, BC

Table 1. VHF signal status and location of boreal caribou and wolf collars detected during the July 14-15, 2014 SCEK fixed-wing telemetry monitoring flight.
