Executive Summary

The BC Seismic Research Consortium (BC SRC) was established by Geoscience BC, the Canadian Association of Petroleum Producers (CAPP), Natural Resources Canada (NRCan) and the BC Oil and Gas Commission (BCOGC). It followed a recommendation from the BCOGC in response to concerns regarding induced seismicity associated with hydraulic fracturing in the Horn River Basin. The Yukon Geological Society (YGS) joined the consortium briefly in 2016 to provide an expanded and comprehensive network covering oil and gas activity in Northeastern British Columbia (NE BC), but due to funding challenges, the YGS left the consortium the following year. The BC SRC is responsible for maintaining the PQ and 1E seismic networks, and collaborates with McGill University for station maintenance of the XL network. In addition, the BC SRC has access to additional stations from the CN, EO, and S3 networks operated by NRCan, the University of Calgary (U of C), and Symroc respectively. See Table 1 for network and station details.

The BC SRC is made up of representatives from each consortium partners – Geoscience BC, CAPP, BCOGC, NRCan, and the BC Oil and Gas Research and Innovation Society (BC OGRIS). Funding for the BC SRC is shared between Geoscience BC and the BC OGRIS.

This report summarizes the actions and research taken by the BC SRC for the period April 1, 2021, to May 1, 2022. This report contains an update on seismic monitoring efforts within NE BC and an overview of the seismicity detected over the past year. Some improvements have been made to routine monitoring in NE BC and are detailed in this report. Publications and presentations undertaken by members of the BC SRC are also included. The report also contains an appendix with details of seismic events that occurred during the period April 1, 2021, to May 1, 2022. There were 6590 events detected, 129 of those have a local magnitude greater than 2.0 with the largest event having a local magnitude of 3.6. There were no reports of damage relayed to the BC Oil & Gas Commission.

Update on Seismic Monitoring in NE BC

The seismic monitoring capacity in Northeastern BC has experienced some gains and losses over the past year. At the very end of this report period, (end of April 2022) six stations assigned to the XL network and belonging to Ruhr University were removed due to their project coming to an end. On the positive side, five experimental stations designed and maintained by Symroc Business and Project Management Ltd. (Symroc) were deployed and added to routine earthquake monitoring processes as of November, 2021. Preliminary seismic events that have been detected over the past year are included in this report. The finalized version of event details will be published in a Geological Survey of Canada (GSC) Open File report at a later date. The event details are shown in Appendix A and include date, time (UTC), latitude, longitude, depth, and local magnitude. The details of each station used to locate events from April 1, 2021 to May 1, 2022 are provided in Table 1. A map of their locations can be seen in Figure 1, and periods of station data availability can be seen in Figure 2.

Table 1. Seismic stations used to locate events for the induced seismicity monitoring project.

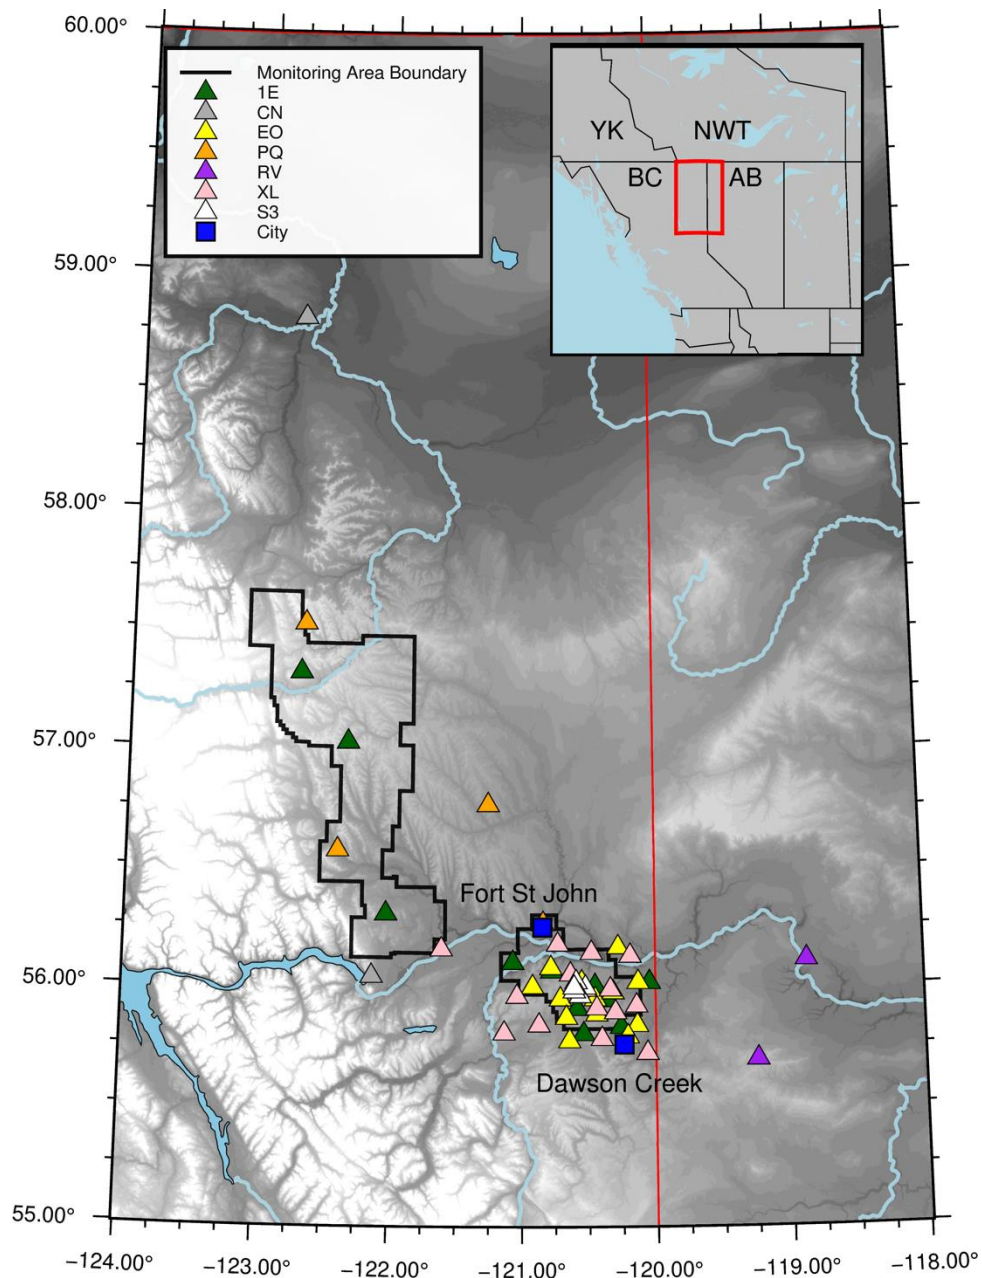

Figure 1. Stations used to locate events in NE BC from April 1, 2021, to May 1, 2022.

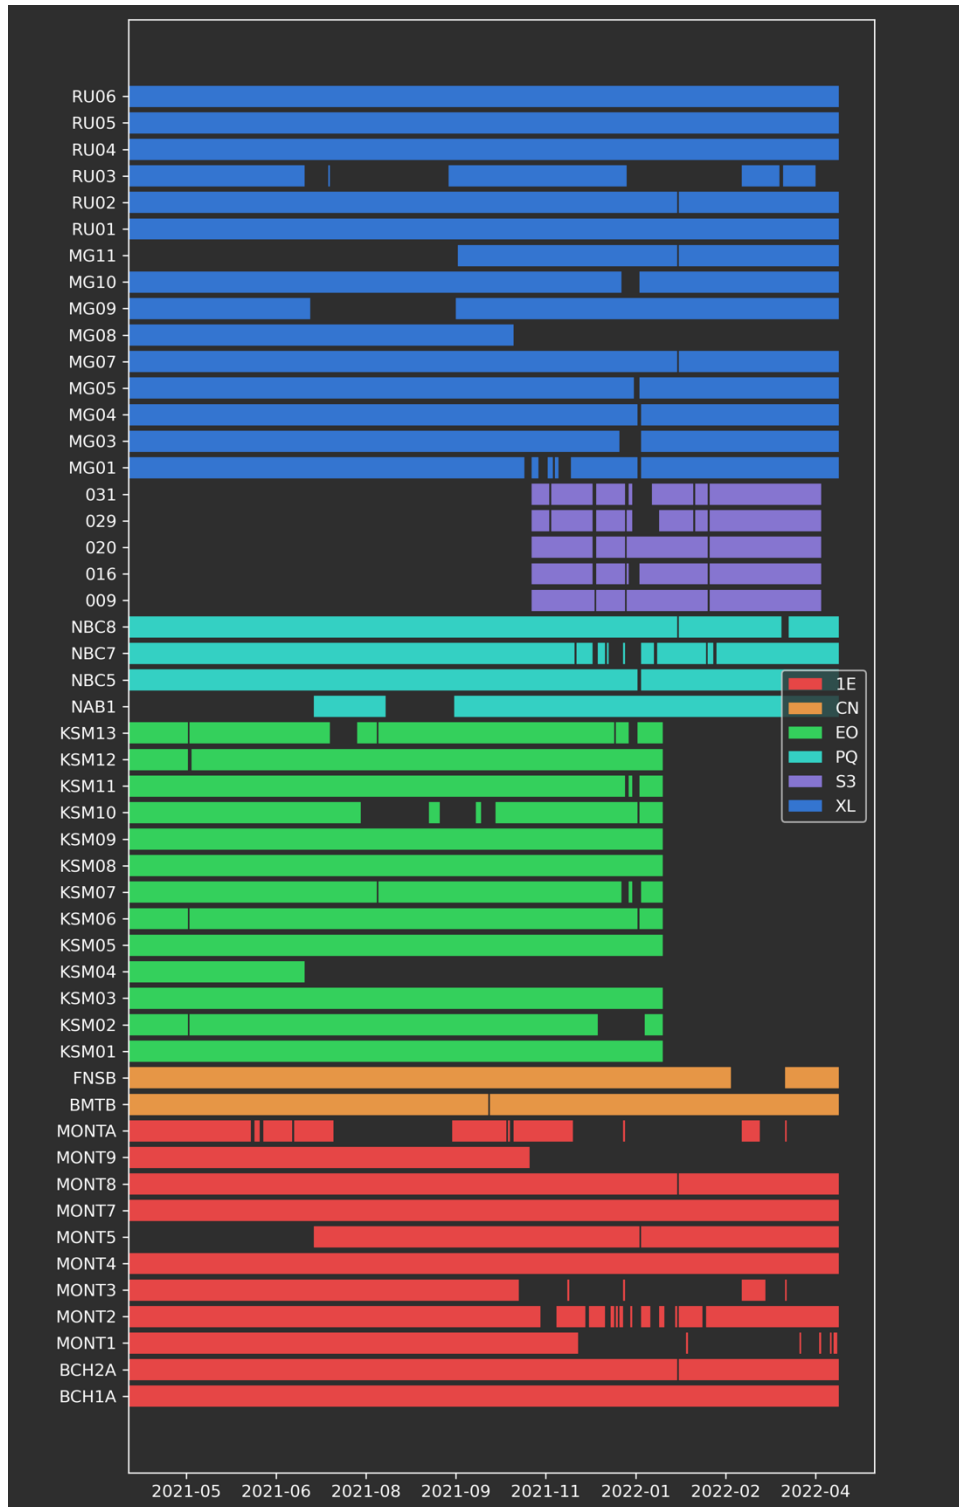

Figure 2. Station data availability from 2021-04-01 through to 2022-05-01. The availability shown is what was available at the time of writing. The data for stations belonging to the EO network (shown in green) are available on a 100-day embargo. Stations that were not used to locate events in the past year are not shown

Seismicity from April 1, 2021 to May 1, 2022

The seismicity in NE BC that was detected from April 1, 2021 to May 1, 2022 is shown in Figure 3. There were 6590 events during that period with 6275 in or near the Kiskatinaw Seismic Monitoring and Mitigation Area (KSMMA) and 315 in or near the northern Montney (NM) areas. There were 129 events with a local magnitude greater than 2 and no events above magnitude 4. Figure 4 shows the magnitude frequency distribution and Gutenberg-Richter relationship of seismicity in the NM and KSMMA, respectively. The magnitude of completeness for the NM was ~ 1.3 and was ~ 1.0 for the KSMMA (Figure 4).

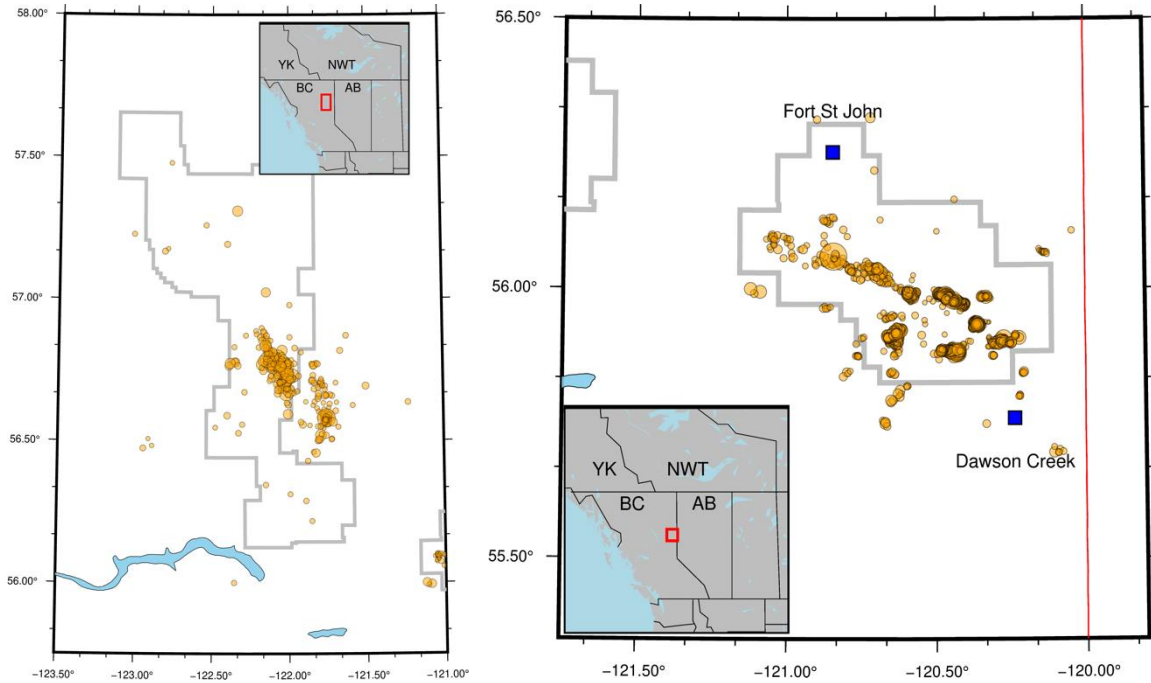

Figure 3. Seismicity occurring in NE BC in the NM (left) and the KSMMA (right).

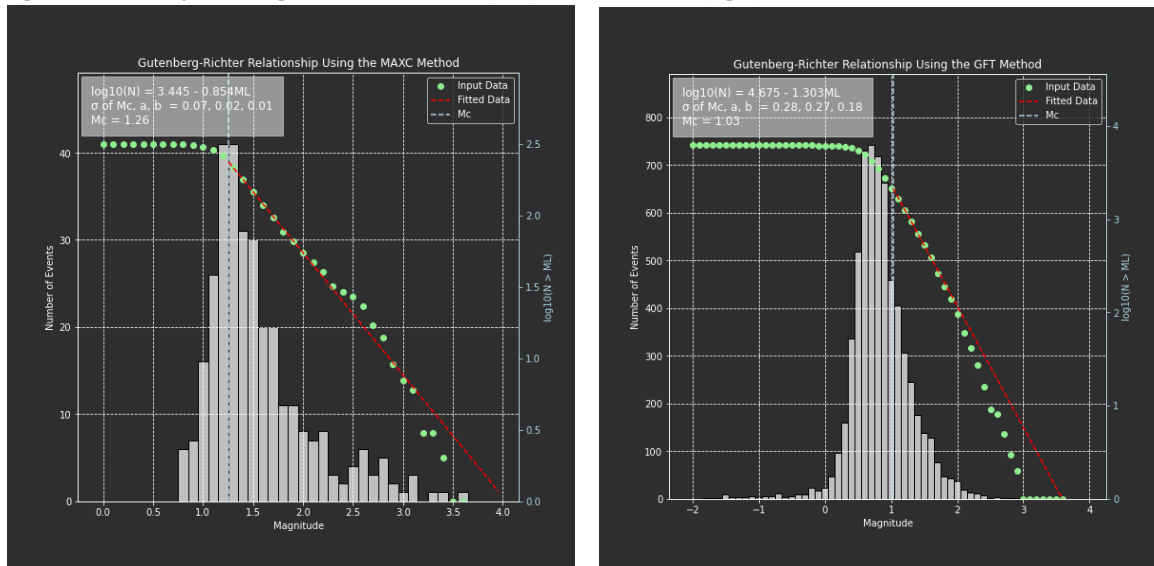

Figure 4. Magnitude of completeness in NE BC in the NM (left) and the KSMMA (right).

Changes to Routine Seismic Monitoring in Northeast BC

The earthquake detection system that was used to create last year's earthquake catalogue was improved to add a feature to automatically relocate earthquakes using the relative relocation program, GrowClust, (Visser et al., 2021, Trugman et al., 2017). The earthquake relocation results allow for increased location accuracy for events relative to each other and can reveal features of interest. For example, many of the events that occur in the KSMMA occur along NE-SW trending lineations (Figure 5). The mapping of these lineations may be useful to help mitigate the risk of seismicity stemming from nearby well completion or disposal operations reactivating those geological features.

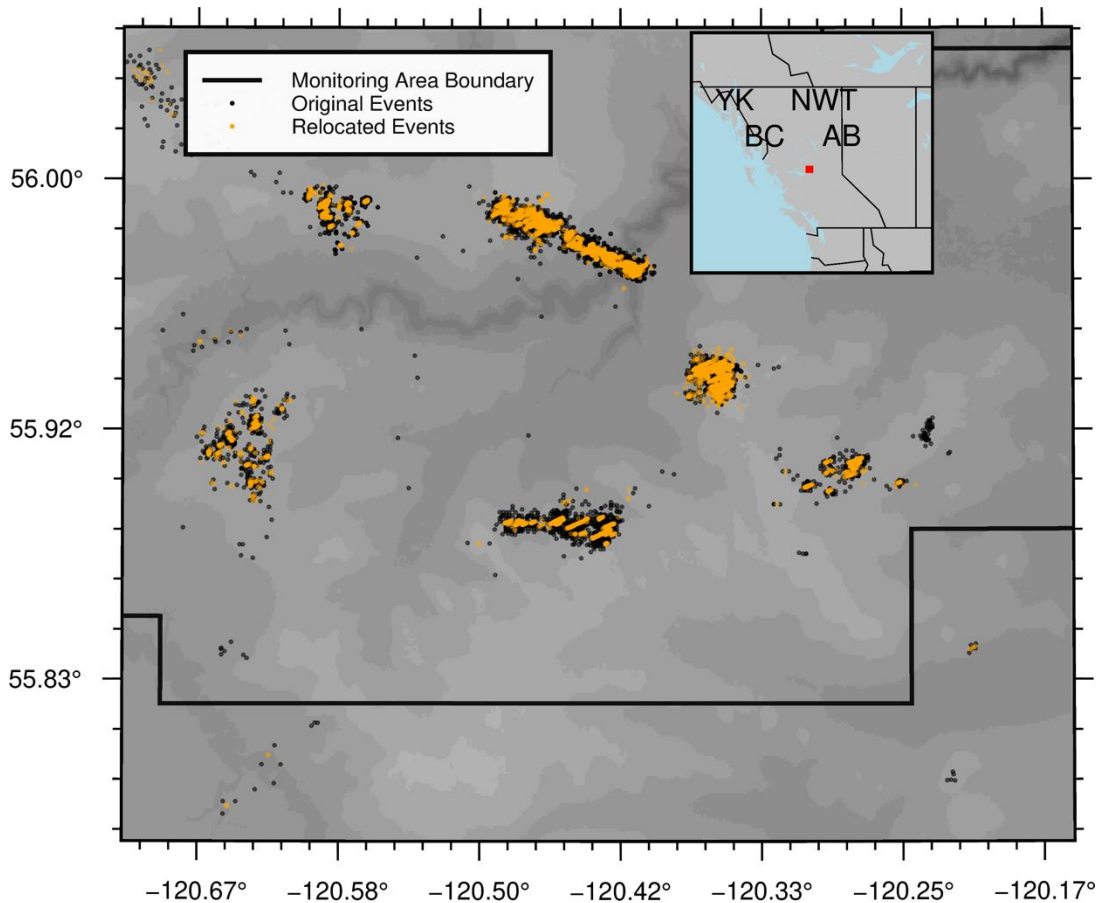

Figure 5. Original and automatically relocated earthquakes in the KSMMA as of May 1st, 2022. Relocated events are shown in orange while the original event locations are shown in black. NE-SW trending lineations are visible in the relocated dataset.

In addition to the relocation capability, the earthquake detection system has been improved to allow seismicity within the NM and KSMMA to be spatiotemporally attributed to nearby active hydraulic fracturing and water disposal operations (Figure 6). The associations and their statistics are produced with a maximum of 1-day latency, providing injection data is available. The associations are sent to the BCOGC to be used as a reference for their regulation of oil & gas operations within NE BC.

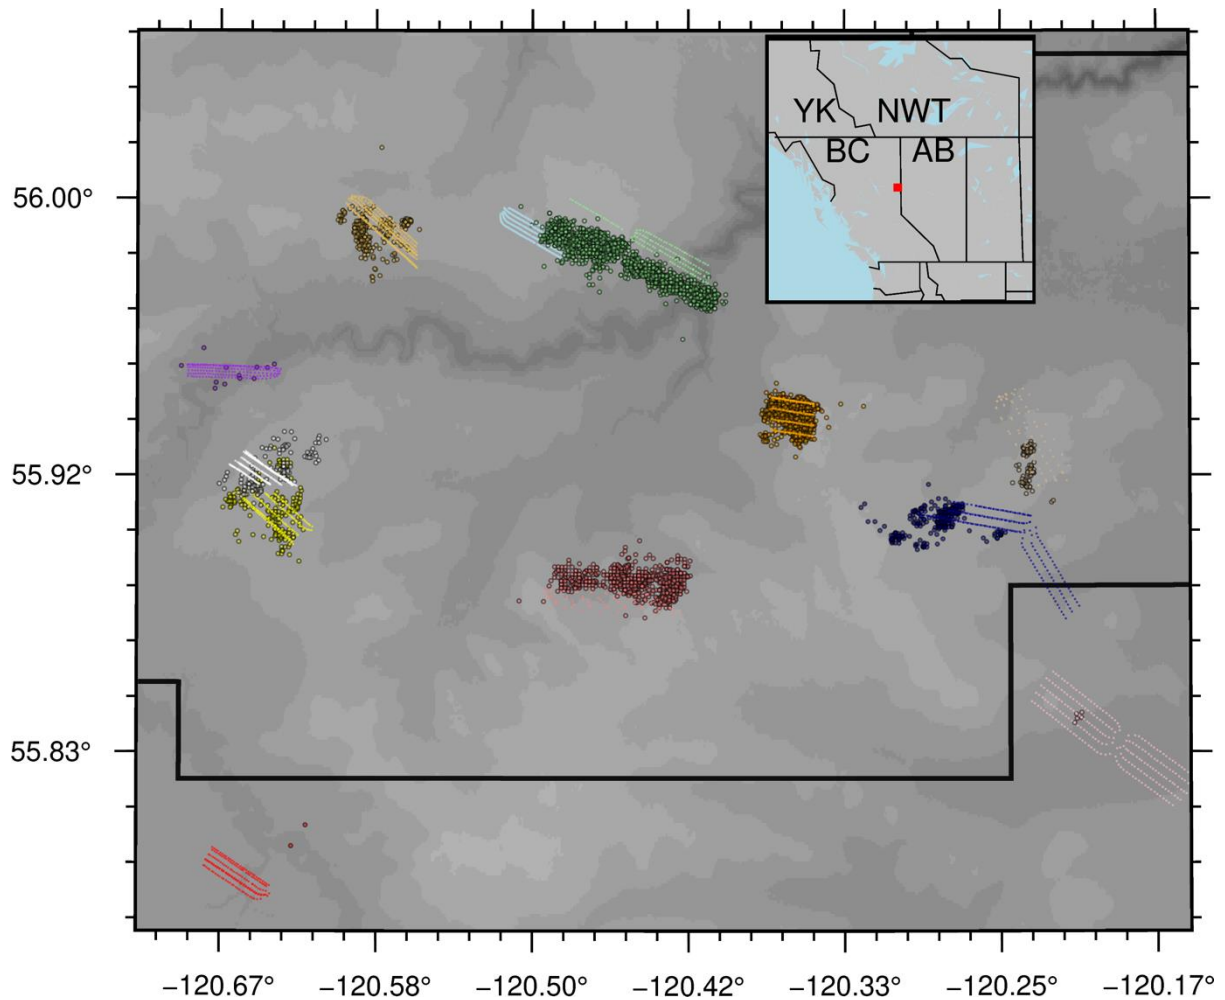

Figure 6. Events from April 1, 2021 to May 1, 2022 that have been automatically associated with hydraulic fracturing well pads within the KSMMA as of May 1st, 2022. Associated well pads and earthquakes are shown in the same colour. Seismic events are shown with black edges while the horizontal well-paths are shown without the black edge.

The statistical association of seismicity with individual hydraulic fracturing wells has allowed the study of why some wells trigger events in greater numbers than others. One key observation from this analysis has shown that wells targeting the Lower Middle Montney (LMM) member trigger earthquakes in greater numbers than those targeting the Lower Montney (LM), Upper Middle Montney (UMM), and Upper Montney (UM) members. For events and wells with available data from April 1, 2021 to May 1, 2022, ~84% of earthquakes were associated with the LMM, ~9% to the UMM, ~6% to the UM, and 0% to the LM (Figure 7). Wang et al., 2022 found a variety of factors that influence seismogenic behaviour in the KSMMA including injection type (WD vs HF), injection volume, regional geology, and the target formation. The most significant influential factor they found was the injection type, indicating that hydraulic fracturing operations in the KSMMA play a more significant role in inducing events than water disposal operations.

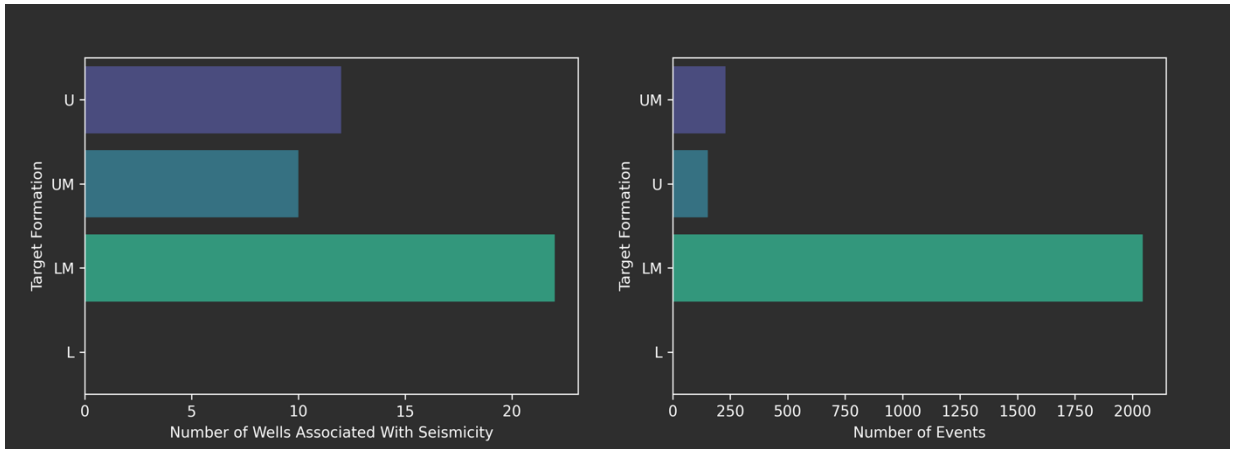

Figure 7. Number of hydraulic fracturing wells associated with seismicity by their target formation in the KSMMA (left). Number of events associated with wells by well target formation in the KSMMA (right). Data presented is using all available data as of May 1st, 2022.

The Tower Lake Study

The BC SRC collaborated with Symroc to study events triggered from a hydraulic fracturing pad in the Tower Lake area of the KSMMA. The study used data from 36 stations and enclosed a roughly square area around the well pad with dimensions ~6km x 6km (Figure 8). Using the waveforms from those stations, the data was analyzed using the phase detection program EQTransformer (Mousavi, 2020) and phases were used to create a catalogue of 3036 events. Those events were then relocated with HypoDD (Waldhauser, 2001) with over 2700 events being successfully relocated. Preliminary local magnitudes for the events detected by the study range from 0.9 – 2.4. The original and relocated catalogues are the basis for ongoing research.

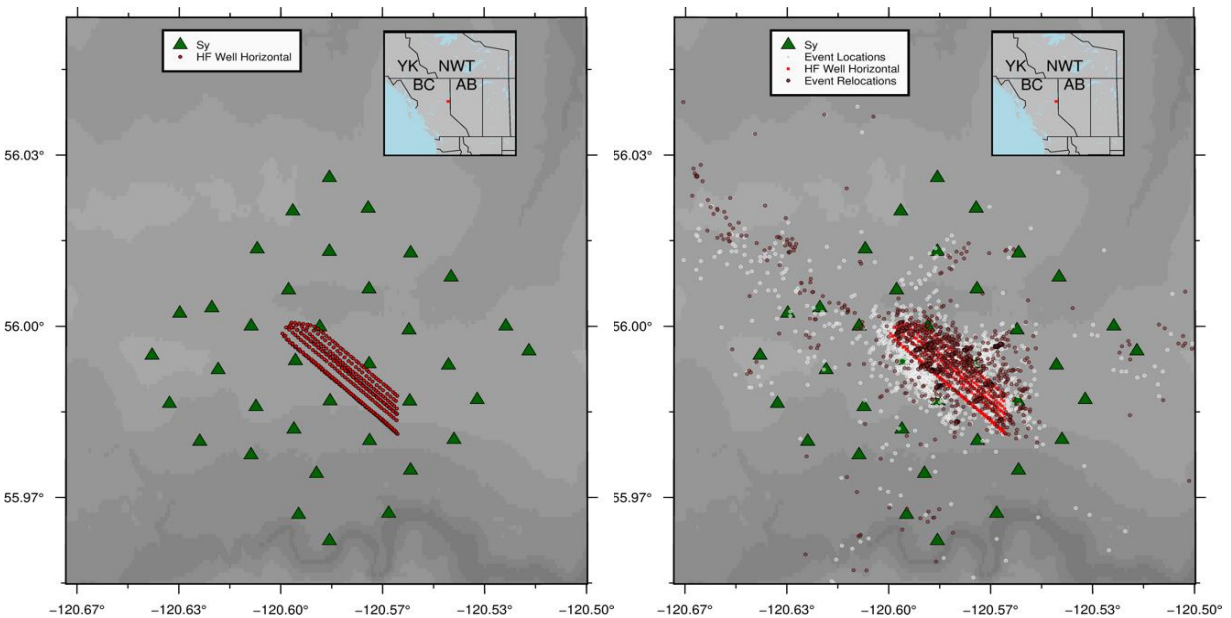

Figure 8. Symroc network stations (Sy) and the studied well pad in the KSMMA from January 1, 2021 to June 1, 2021 (left). Events located using the Symroc stations and relocated event locations from the HypoDD relocation algorithm (right).

Research Communication

Members of the BC SRC are associated with the following presentations since April 1, 2021.

Bombardier, M., J.F. Cassidy, H. Kao, and S. Dosso (2021). Novel location method for ETS tremor in northern Cascadia, Seismological Society of America Annual Meeting, 19-23 April.

Work In Progress

There is a variety of fieldwork to be performed on seismic networks in NE BC over the next year, including: 1) performing an inventory of all seismic station equipment in the field and in storage in NE BC; 2) decommissioning stations that used satellite communication which, due to their remoteness, provide little benefit to seismic monitoring; 3) deployment of four additional seismic stations, and; 4) maintenance of stations that are offline or are having other issues. Locations for the deployment of the new stations are still being determined.

The automatic location system is set to be improved to work in near-real-time as a possible replacement for the existing SeisComP3 real-time system. The functionality of the near-real-time system will be focused on providing high quality earthquake locations and magnitudes to the BCOGC in a timely manner to assist the Regulator with decision making when seismic events occur in NE BC.

Conclusions

With the addition of 5 new seismic stations belonging to the S3 network, seismic monitoring in NEBC was improved for part of the past year. The removal of 6 stations belonging to the XL network at the end of the report period means that going forward, the magnitude of completeness will be higher in some areas than before. Four additional stations are set to be deployed this summer, which will help to lower the magnitude of completeness in their area. A total of 6590 events were detected between the magnitudes of -1.8 and 3.6 from April 1, 2021 to May 1, 2022. The vast majority of events occurred within or near the bounds of the seismic monitoring areas set out by the BCOGC within the Montney play. Various research projects were performed by the members of the BC SRC over the past year. These include an earthquake catalogue created from our earthquake detection and location system, an analysis of the factors most affecting seismogenic potential in the KSMMA and NM, and the creation of a new deep learning approach for locating seismicity which can further help to improve seismic monitoring capabilities in NE BC. A full list of the presentations and publications associated with members of the BC SRC over the last year has been included.
