SCIENCE AND COMMUNITY ENVIRONMENTAL KNOWLEDGE FUND BOREAL CARIBOU TELEMTRY PROGRAM

FIXED-WING TELEMTRY MONITORING FLIGHT – Oct 25-Nov 01, 2014

Date: Nov 15, 2014

Attention: Brian Thomson

Executive Summary

One hundred forty-nine boreal caribou collar frequencies and 17 wolf collar frequencies were scanned during a monthly fixed-wing telemetry monitoring flight conducted on October 25 and November 01, 2014. One hundred forty-five caribou collars were heard transmitting normal VHF signals, 1 was transmitting a mortality signal (SCEK094), and 3 were not detected. No wolf mortality signals were detected, although several GPS wolf collar are presumed to have reached the end of their battery lives.

Background

During the winters of 2012-13 and 2013-14, 204 adult boreal caribou were radio-collared in British Columbia's boreal caribou ranges as part of the *British Columbia Boreal Caribou Implementation Plan* (BCIP). On October 25 and November 01, 2014, Diversified Environmental Services (DES) conducted a fixed-wing monitoring flight under contract to the Science and Community Environmental Knowledge Fund (SCEK), on behalf of the Research and Effectiveness Monitoring Board (REMB). Fixed-wing monitoring flights are conducted at monthly intervals throughout the year in order to identify mortality events to be followed up by ground-based mortality investigations and collar recoveries and to track potential long distance seasonal movements of VHF-collared caribou.

Objectives

The objective of the October 2014 monitoring flight was to determine the approximate location and VHF beacon status of all boreal caribou and wolf collars believed to be active in the survey area. These included caribou collars deployed on behalf of SCEK, caribou and wolf collars deployed on behalf of the Ministry of Forests, Lands, and Natural Resource Operations (MFLNRO), and pre-existing collars known to have entered BC's boreal caribou ranges from adjacent jurisdictions.

Methods

The monitoring flight was conducted using a Cessna 180 fixed-wing aircraft equipped with 1 outward-facing directional antenna affixed to each wing strut. Collar frequencies were scanned using Lotek™ STR 1000 and Lotek BioTracker telemetry receivers. The flight was conducted at 700-1,000 m above ground level at an average speed of 160 km/hr. The VHF beacon status of all detected collars was recorded on hard copy forms. In the case of VHF collars (Lotek LMRT4), status was recorded as either normal (60 pulses per minute (ppm)) or mortality mode (120 ppm) and a location (+/- 1 km) was recorded using a hand-held GPS unit. In the case of GPS/satellite collars (ATS Iridium, Vectronic Vertex, and Lotek LifeCycle), additional diagnostic VHF beacon patterns were recorded where applicable. As GPS/satellite collars are programmed to log multiple daily locations with high precision, additional effort to obtain collar locations after VHF signal detection is not necessary. Therefore, waypoints for

GPS/satellite collars were typically recorded at the location from which the collar was heard, with corrections for estimated bearing and distance, unless the VHF beacon status indicated a collar malfunction or mortality, in which case, more precise locations were obtained.

Results

The first day of the October 2014 monitoring flight was conducted on October 25. An extended period of low cloud and snow fall prevented completion of the monitoring event until November 01. One hundred forty-nine caribou collar frequencies were scanned during the monitoring flight, including 143 SCEK collars (27 ATS Iridium, 30 Vectronic Vertex, 11 Lotek LifeCycle, and 75 Lotek VHF), 2 Alberta VHF collars, and 4 previously-deployed MFLNRO VHF collars. In addition, 17 wolf collar frequencies were scanned during the October flight (13 Lotek Iridium and 4 Lotek VHF).

Results of the October 25-November 01, 2014 monitoring flight are presented in Table 1. Flight paths searched within and adjacent to each core habitat area are shown in Figure 1. Total flight line distance was 2,811 km. Of 149 caribou collar frequencies scanned, 145 normal VHF signals and 1 mortality signal were detected. SCEK094 (West Kotcho; Lotek VHF) was the only caribou mortality detected in October 2014. The remaining 3 caribou collars include one GPS collar believed to have failed in May 2013, shortly after deployment (SCEK042, Milligan, ATS Iridium), a second GPS collar which stopped transmitting GPS data in September 2014 (SCEK184, Calendar, ATS Iridium), and one MFLNRO Lotek VHF collar which appears to have exceeded its battery life (BC1001, Parker).

At the time of the October 2014 monitoring flight, 3 of the 4 Calendar caribou previously north of the NT/BC border had returned to BC.

Seventeen wolf collar frequencies were scanned during the October 25-November 01, 2014 monitoring flight, including 13 Lotek Iridium and 4 Lotek VHF. Of the 13 GPS/satellite wolf collars scanned, 5 had normal VHF beacon function and the remaining 8 were not detected. Of these 8, two had previously dispersed to the Northwest Territories beyond VHF range; one stopped transmitting GPS data on August 15, 2014 (BW010; Snake Pack) and the other is believed to have died in early September (BW028; Snake Pack). The remaining 6 undetected collars include one with a failed VHF signal but current GPS data (BW012; Big Arrow Pack), and 5 collars that have ceased GPS data transmission. These include collars that are nearing the end of their 2-year battery life.

Of the 4 VHF wolf collars scanned, 2 had normal VHF signals, one is assumed to have failed or the wolf dispersed soon after deployment in 2013 (BW007; Snake Pack), and the fourth was not detected but is assumed operational (BW026; Kwokullie Pack).

There were no opportunities for First Nations field assistance on this monitoring flight.
