## SCIENCE COMMUNITY ENVIRONMENTAL KNOWLEDGE FUND BOREAL CARIBOU TELEMETRY PROGRAM

### FIXED-WING TELEMETRY MONITORING FLIGHT – Jun 28-Jul 03, 2013

**Date:** July 03, 2013

**Attention:** Megan Watters  
Ecosystems Biologist  
Ministry of Forests, Lands & Natural Resource Operations  
Fort St. John, BC

#### *Background*

During the winter of 2012-13, 164 female boreal caribou were radio-collared in British Columbia's boreal caribou ranges as part of the *British Columbia Boreal Caribou Implementation Plan* (BCIP). Between June 28 and July 03, 2013, Diversified Environmental Services (DES) conducted a fixed-wing monitoring flight under contract to the Science Community Environmental Knowledge Fund (SCEK), on behalf of the Research and Effectiveness Monitoring Board (REMB). Fixed-wing monitoring flights are conducted at monthly intervals throughout the year in order to identify mortality events to be followed up by ground-based mortality investigations/collar recoveries and to track potential long distance seasonal movements of VHF-collared caribou.

#### *Objectives*

The objective of the June 28-July 03, 2013 monitoring flight was to determine the approximate location and VHF beacon status of all boreal caribou and wolf collars believed to be active in the survey area at the time of the flight. These included caribou collars deployed on behalf of SCEK, caribou and wolf collars deployed on behalf of MFLNRO, and pre-existing collars known to have entered BC's boreal caribou ranges from adjacent jurisdictions.

#### *Methods*

The monitoring flight was conducted using a Cessna 180 fixed-wing aircraft equipped with 1 outward-facing directional antenna affixed to each wing strut. Collar frequencies were scanned using a Lotek™ STR 1000 telemetry receiver. The flight was conducted at 700-1000 m above ground level at an average speed of 160 km/hr. The VHF beacon status of all detected collars was recorded on hard copy forms. In the case of VHF collars (Lotek LMRT4), status was recorded as either normal (60 ppm) or mortality (120 ppm) and a location (+/- 1 km) was recorded with a hand-held GPS unit. In the case of GPS/satellite collars (ATS Iridium and Vectronic Vertex), additional diagnostic VHF beacon patterns were recorded where applicable. As GPS/satellite collars are programmed to log multiple daily locations with high precision, efforts to obtain collar locations during fixed-wing flights are not necessary. Therefore, waypoints for GPS/satellite collars were typically recorded at the location from which the collar was heard, unless the VHF beacon status indicated a collar malfunction or mortality, in which case more precise locations were obtained.

### *Results*

One hundred sixty-five caribou collar frequencies were scanned during the June 28-July 03, 2013 monitoring flight, including 149 SCEK collars (104 VHF, 31 ATS Iridium, and 14 Vectronic Vertex), 5 Alberta SRM collars, and 11 previously-deployed MFLNRO collars (10 VHF and 1 ATS Iridium). In addition, the frequencies of 15 Lotek Iridium and 7 Lotek VHF wolf collars were scanned.

Results of the June 28-July 03 monitoring flight are presented in Table 1. Flight paths searched within and adjacent to each core habitat area are shown in Figure 1. Total flight line distance was 3,207 km. Of 165 caribou collar frequencies scanned, 146 normal VHF signals and 1 false mortality signal (Vectronic SCEK143) were detected, indicating live animals. Seven mortality signals were detected, indicating dead animals. All 7 mortality signals appeared to be associated with animals killed subsequent to the May 15-16 monitoring flight and included 5 SCEK VHF collars, 1 SCEK Iridium collar, and 1 previously-deployed MFLNRO VHF collar (BC1021). Three of the mortalities were located in the Calendar Range, 2 in the Snake-Sahtaneh Range, and 1 each in the Chinchaga and Maxhamish ranges.

The remaining 11 animals were not detected during the monitoring flight. These included 1 ATS Iridium collar suspected to have failed (SCEK042; Milligan), 1 previously-deployed VHF collar suspected to have exceeded its battery life (BC1000; Parker), and 2 Alberta VHF collars last found in the Milligan Core. The remaining 7 undetected caribou collars were newly-deployed SCEK VHF collars from the Chinchaga and Calendar ranges.

Twenty-two wolf collar frequencies were scanned during the June 28-July 03, 2013 monitoring flight, including 15 Iridium collars and 7 VHF collars. Of the 7 VHF wolf collars, 4 had normal VHF signals and 3 could not be located, including 1 wolf in each of the Snake, Clarke, and West Clarke packs. Of the 15 Iridium collars, 8 appeared to have normal VHF and Iridium function. Of the remaining 7 Iridium wolf collars, BW012 was transmitting Iridium data but appeared to have no VHF signal. BW011 had a normal VHF signal but has never transmitted Iridium data. BW003 stopped transmitting data on Feb 09 and appeared to have no VHF signal. BW006 ceased Iridium data transmission on March 13 but had a normal VHF signal. VHF signals from BW013 and BW021 could not be detected despite scanning directly over recent Iridium fix locations. BW010 was transmitting Iridium data from approximately 60 km north of the Northwest Territories border.

### *Discussion*

The number of undetected VHF collars from the Calendar Range increased from 2 to 4 since the May 15-16 monitoring flight. VHF collars have a low incidence of failure, suggesting caribou movement significantly beyond the Alberta and/or Northwest Territories borders. A search pattern up to 14 km into the NWT during the July 03 flight failed to detect any of the missing collars. The search area will be extended to the Bistcho Lake region of Alberta during the next monitoring flight.

There were no opportunities for First Nations field assistance on this monitoring flight.

Cordially,

Brad Culling, R.P.Bio
